DETAILED ACTION

Allowable Subject Matter

1. The following is an examiner's statement of reasons for allowance: While Negash et al "A temporal domain audio watermarking technique, IEEE 2003" teaches the use of audio watermarking techniques to embed extra information into audio signals. The goal is to hide prespecified data carrying some information into the audio stream such that it is not audible to the human ear (i.e., transparent) and is, at the same time, resistant to removal attacks (i.e., robust). The system is referred to as modified audio signal keying (MASK). In MASK, the short-time envelope of the audio signal is modified in such a way that the change is imperceptible to the human listener. The MASK system can easily be tailored for a wide range of applications. Moreover, informal experimental results show that it has a good robustness and audibility behavior. Negash et al clearly teaches a method of detecting a bi-phase envelope without having access to the unwatermarked audio signal, the method involves envelope energy estimations of the watermarked audio signal. Keating et al (US 7,171,017) teaches the image processing apparatus comprises a combining processor operable to introduce the data to be embedded into at least one of the first and second fields of the image frame. As such a likelihood of a perceivable effect of the embedded data on the image may be reduced, because the images are viewed as a frame. The embedded data may also have an increased likelihood of being detected because some processing may effect the image frame more then the fields of the image. The combining processor may be operable to represent the data to be embedded in a transform domain form, and, in combination with a transform processor, combine the data to be embedded with the first and/or second fields with the image in a transform domain form or a spatial domain form. The

transform domain may provide a plurality of sub-bands and the data to be embedded may be introduced into at least one of the sub-bands of the transform domain form of the first and/or second fields of the image. Furthermore, the combining processor may be operable to introduce data to be embedded into at least one other sub-band, and the combining processor may be operable in combination with the transform processor to combine the data in the other sub-band with the frame of image data in the transform or the spatial domain.

None teaches determining first and second characteristics and determining if a watermark is embedded by comparing watermark symbol estimates with a reference symbol pattern as claimed in claim 1 in addition to the features of claims 2-13. The Examiner finds no reason or motivation to combine the above references in an obviousness rejection thus placing the application in condition for allowance. This watermark detection improvement would be advantageous by allowing a detection performance with reduced complexity and facilitated implementation.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

2. Claims 1-13 are allowed.
